

Learning Styles

I do think that learning styles affect how we learn. I for example have a very hard time with auditory instruction. I do however think that learning styles can be variable and fluid. While I do struggle with auditory instructions I do very well with visual instructions but if I have something to learn from that's an audio/visual experience I do far better. For example a well structured lecture with a slide show or youtube video.

On the test I scored.

- Auditory 30%
- Tactile 30%
- Visual 40%

I think this spread is roughly correct. However as I said before I think the styles are variable. Some days auditory distractions are a minor nuisance on others they make it nearly impossible to learn or work.

So while I do think learning styles affect how we learn I also think that like anything that appears in psychology it appears in a wide a deep spectrum. In that way the utility of learning styles seems to be identifying to oneself and others what will be an effective way to learn presently.

I'm excited about the rest of the Creative Coding course because it seems like it will align with my more visual/tactile method of learning. I'm also glad it will help me stretch my metaphoric learning muscles. I think programming in general is a great way to use all three styles between listening to the principles of coding, reading the specific code, and putting it into practice.
